# What we want?

- A real-time multiplayer game that share the concept, players control balls that grow by consuming smaller balls of other players and scattered food item
- A software consist of performance, concurrency model, and memory safety

# Shared - for common shared code

## Game Objects

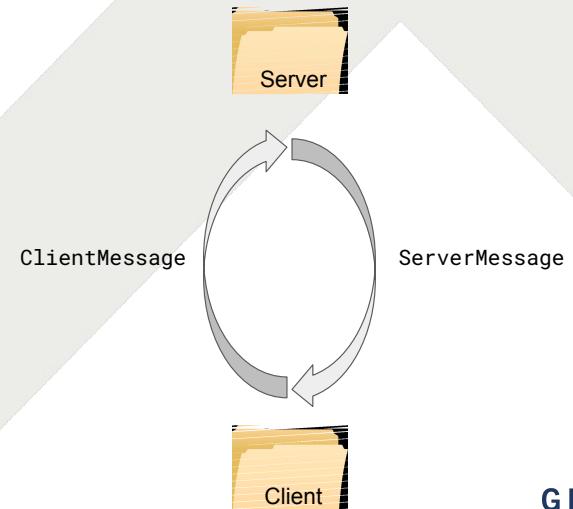

- Player struct: id, name, pos, radius, score, speed, velocity.
- Dot struct: pos, radius, score value (2/5/10), color.
- World boundaries & constants.

## Game Mechanics

- Size  $\propto$  score
- Speed  $\propto$  1/score
- Dot eating logic
- Player-vs-player eating logic
- Respawn logic
- Collision detection

## Protocol & Serialization

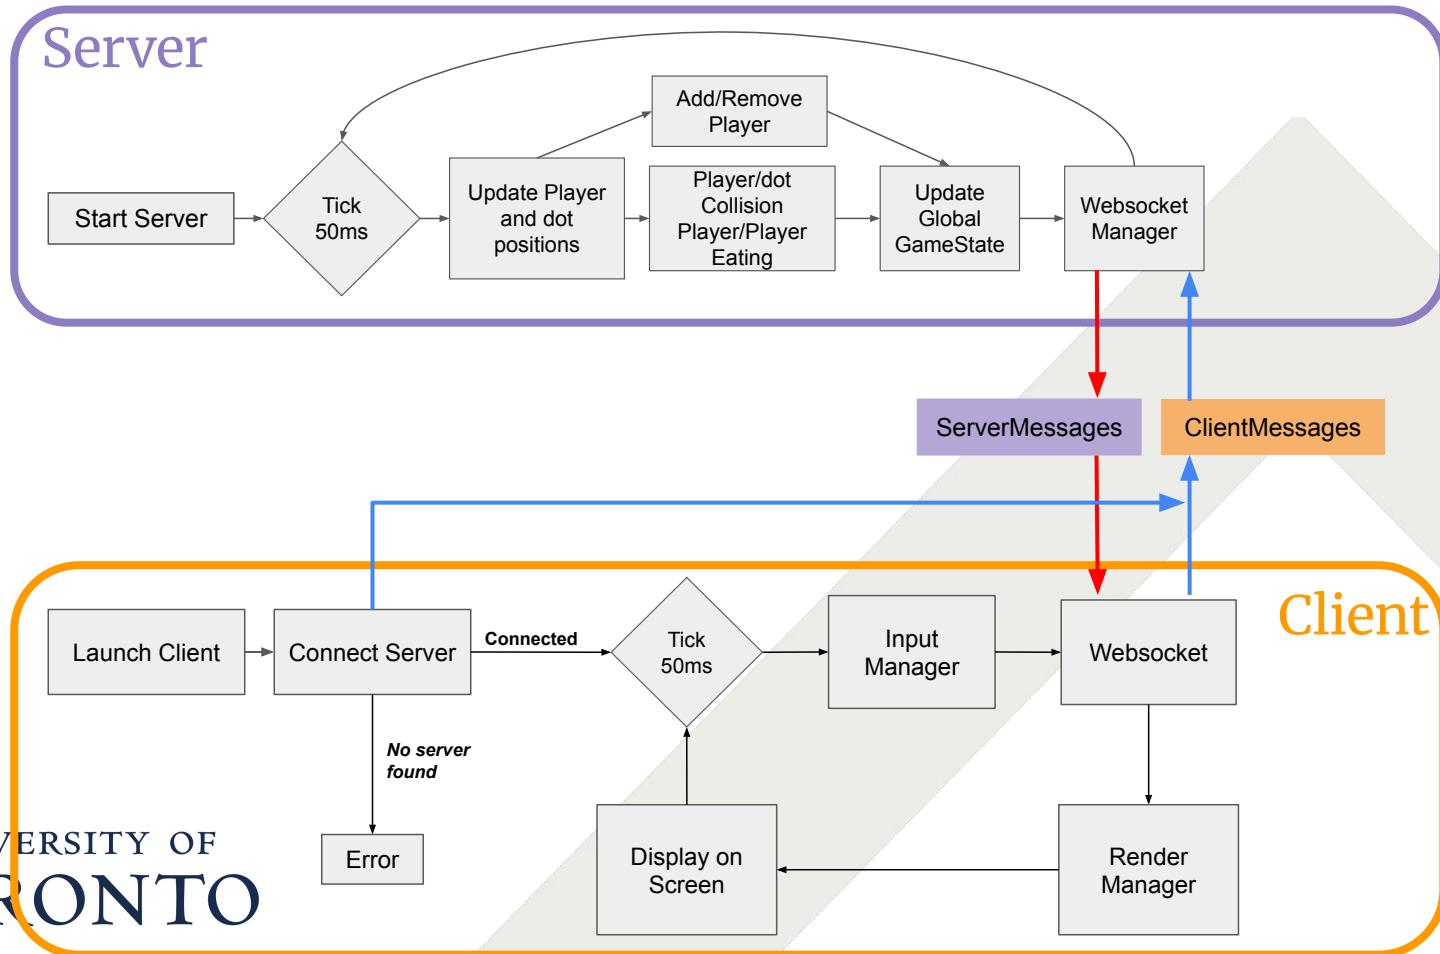

- **ClientMessage**: input, join game, etc.
- **ServerMessage**: state snapshots, acknowledgments.

# Server: Authoritative game engine and networking backend

- Uses **tokio** + **tokio-tungstenite** to handle multiple concurrent WebSocket clients asynchronously.
- Deserializes incoming ClientMessage packets and queues them for the next tick.
- Runs a deterministic 20 Hz tick loop applying game mechanics (movement, collisions, scoring).
- Serializes and broadcasts ServerMessage::StateUpdate snapshots packet to all connected clients.
- Uses **Serde** for all message serialization and shared crate types to ensure consistency with the client.

# Client

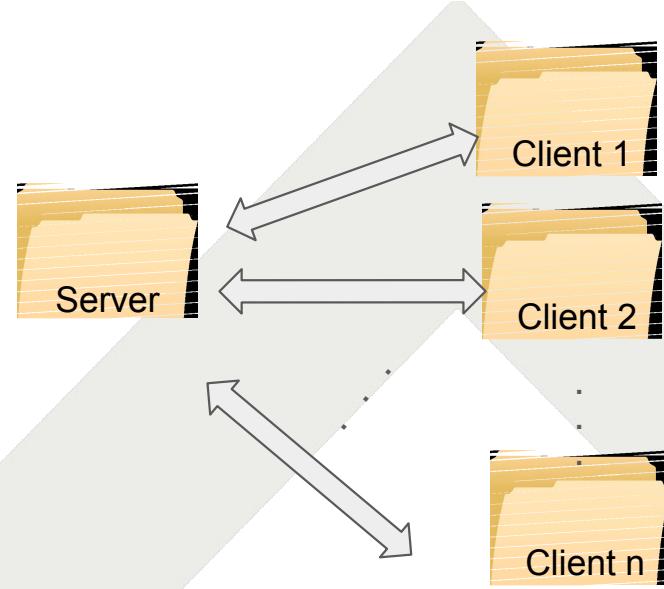

UNIVERSITY OF  
**TORONTO**

**DEFY**  
GRAVITY

# Client

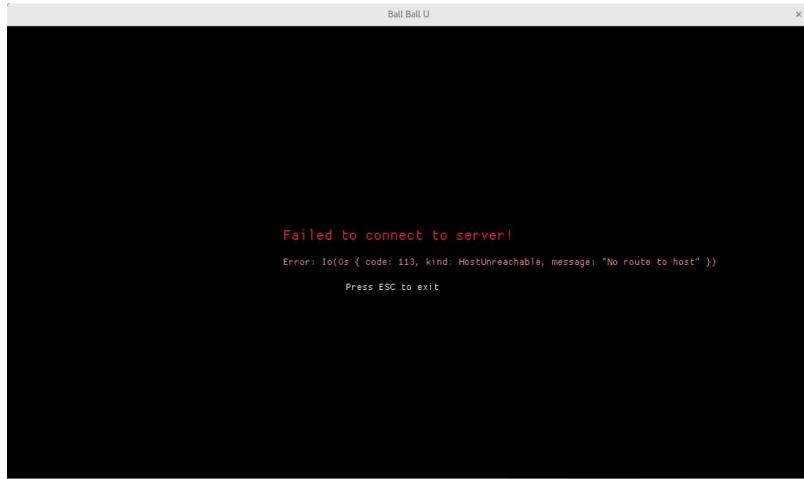

- Uses **tokio-tungstenite** (WebSocket) to send player inputs and receive game snapshots from the server.
- Inputs are serialized using **Serde** and sent as ClientMessage (movement direction + sequence number).
- Receives authoritative ServerMessage::StateUpdate snapshots packet and updates local rendering state.
- Rendering is done using **macroquad**, which draws players, dots, names, leaderboard, and timer.
- Operates in a loop: capture input → send → receive snapshot → render.

# Conclusion

- Ball Ball U is a real-time PvP game fully implemented in Rust.
- We combine a shared protocol crate, an async authoritative server, and a macroquad-based graphical client.
- Our design shows that we can build a responsive and fair real-time multiplayer game entirely in Rust.
